Behavioral Patterns

JS Patterns and Anti Patterns

Malte Brockmann, Jun Heui Cho

Outline

- Behavior pattern in general

- Command

- Memento

- Chain of responsibility

- Observer

Behavior Pattern in general

- Mainly concerned with the communication between objects.

- Describe a process or a flow

- encapsulating behavior and delegating of requests

- increases flexibility

Command

- Encapsulate a request as an object

- Request without knowing anything about the operation being requested. - "Black box execute()"

- Uses: GUI buttons, Networking, Multi-level undo, Progress bar
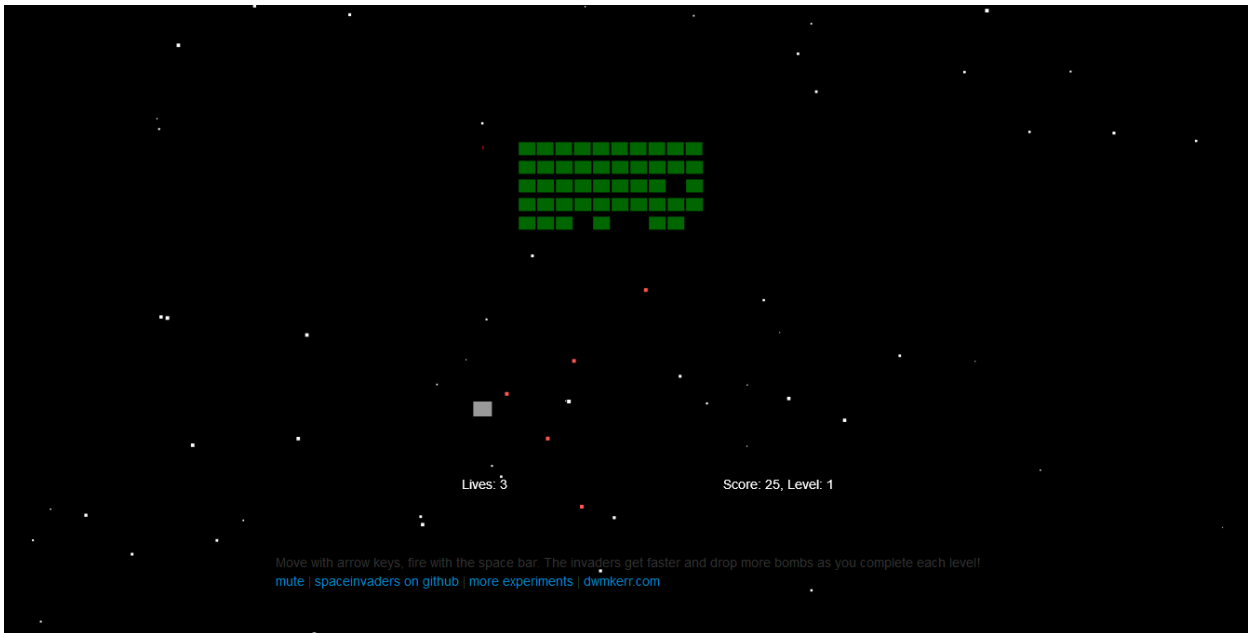

Command - Participants

- **Client**: decides which command at which point

- **Receiver**: knows how to carry out the operation

- **Command**: execute()

- **Invoker**: knows how to execute

http://www.dofactory.com/images/diagrams/javascript/javascript-command.jpg

Spaceinvader

- Retro Game: shooting Spaceinvader

- Level bases

- State bases (Welcome-, GameOver-, PlayState, ect.)
Command - Spaceinvader 1/4

before:

```
if(game.pressedKeys[37]) {
    this.ship.x -= this.shipSpeed * dt;  //dt = Delta time
}                                        //   = 1/fps

if(game.pressedKeys[39]) {
    this.ship.x += this.shipSpeed * dt;
}
if(game.pressedKeys[32]) {
    this.fireRocket();
}
[…]
bomb.y += dt * bomb.velocity;
[…]
rocket.y -= dt * rocket.velocity;
```

Command - Spaceinvader 2/4

after: (Commands)

```
var goLeft = {
    execute : function(obj, speed) {
        obj.x -= speed * dt;
    }
}
var goRight = {
    execute : function(obj, speed) {
        obj.x += speed * dt;
    }
}
var shoot = {
    execute : function(obj) {
        obj.fireRocket();
    }
}
```

```
old
new
```

Command - Spaceinvader 3/4

after: (Commands)

```
var goUp = {
    execute : function(obj, speed) {
        obj.y -= speed * dt;
    }
}

var goDown = {
    execute : function(obj, speed) {
        obj.y += speed * dt;
    }
}
```

Command - Spaceinvader 4/4

after:

```
//The Client is the main loop and the invoker is the user
if(game.pressedKeys[37]) {             //<-receiver
    goLeft.execute(this.ship, this.shipSpeed);
}
if(game.pressedKeys[39]) {
    goRight.execute(this.ship, this.shipSpeed);
}
if(game.pressedKeys[32]) {
    shoot.execute(this);
}
[…]
goDown.execute(bomb, bomb.velocity);
[…]
goUp.execute(rocket, rocket.velocity);
```

Memento

- Capturing and externalizing an object's internal state to be restored later.

- Database of "save point"

- Use: used to avoid disclosure of implementation details

Memento - Participants

- **Originator**: interface to create and restore mementos

- **Memento**: ordinator object

- **Caretaker**: stores mementos
Memento - Spaceinvader 1/4

before:

```
WelcomeState.prototype.keyDown = function(game, keyCode) {
[…]
    game.moveToState(new LevelIntroState(game.level));
};
[…]

GameOverState.prototype.keyDown = function(game, keyCode)
[…]
    game.moveToState(new LevelIntroState(1));
}
```

Memento - Spaceinvader 2/4

after:

```
function Memento(state){
    this.state = state;
    this.getSavedState = function(){
        return this.state;
    };
};
function Caretaker(){
    var saveState = [];
    this.addMemento = function(memento){
        saveState.push(memento);
    };
    this.getMemento = function(index){
        return saveState[index];
    };
};
```
Memento - Spaceinvader 3/4

after:

```
//In this case an Originator is for example a LevelIntroState
caretaker = new Caretaker();
[…]

WelcomeState.prototype.keyDown = function(game, keyCode) {
[…]
caretaker.addMemento(new Memento(new LevelIntroState(game.level)));
game.moveToState((caretaker.getMemento(0)).getSavedState())
    }
};
[…]

GameOverState.prototype.keyDown = function(game, keyCode) {
[…]
game.moveToState((caretaker.getMemento(0)).getSavedState());
    }
};
```

new

Memento - Spaceinvader 4/4
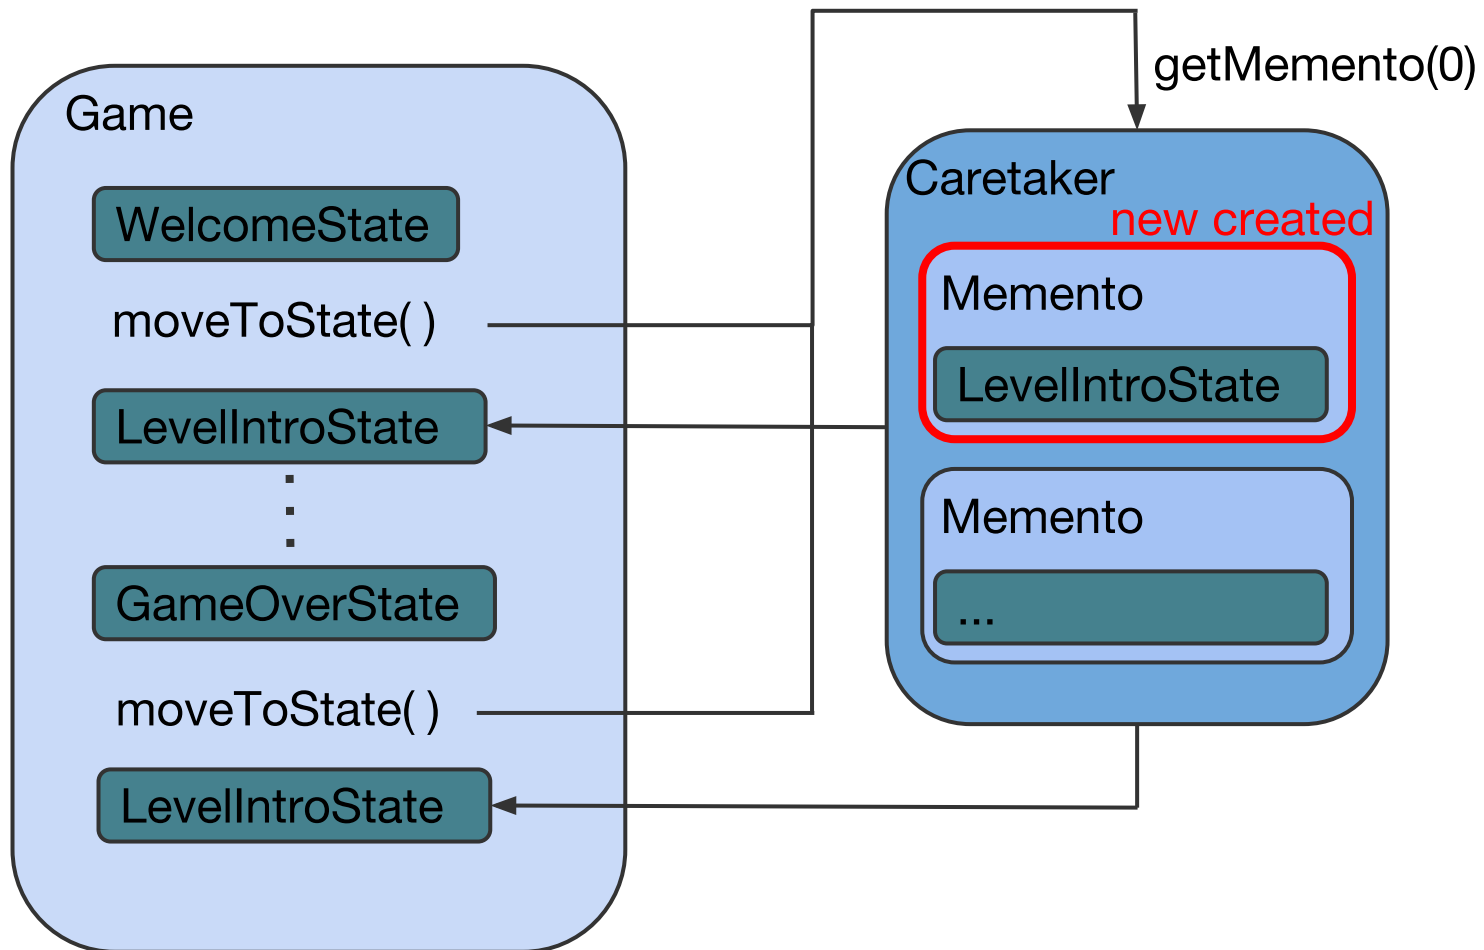

Chain of responsibility

- Avoid coupling between the sender and the receiver of a request.

- More than one object have the chance to handle the request.
- linear search for a handler

Chain of responsibility - Participants

- **Client**: initiator of the request

- **Handler**: has an interface for handling the request

http://www.dofactory.com/images/diagrams/javascript/javascript-chain-of-responsibility.jpg
Tic Tac Toe

- retro Game

- 2 player

- checks winner or

  tie after each turn

- restarts

Chain of responsibility - Tic tac toe 1/7

before:

```
function checkWinner() {
    if (checkRows() === true || checkCols() === true ||
checkDiag() === true) {
        winningPlayer = turn.currentPlayerColor();
        // Alert winner
        endGame("Player " + winningPlayer + ", you win!");
    }
    else if (checkTie() === true) {
        endGame("It's a tie...");
    }
    else {
        turn.changeTurn();
    }
}
```

Chain of responsibility - Tic tac toe 2/7

before:

```
function checkRows() {
    for (i = 0; i < board.length; i++) {
        var same = true;
        for (j = 0; j < board[i].length; j++) {
            if (board[i][j] === 0 || board[i][j] !== board
[i][0]) {
                same = false;
            }
        }
        if (same) {
            return same;
        }
    }
}
```

Chain of responsibility - Tic tac toe 3/7

before:

```
function checkTie() {
    var flattenedBoard = Array.prototype.concat.apply([],
board);
    for(i = 0; i < flattenedBoard.length; i++){
        if(flattenedBoard[i] === 0){
            console.log(i);
            return false;
        }
    }
    return true;
}
```
Chain of responsibility - Tic tac toe 4/7

after:

```
function checkWinner() {
    checkRows();

}
```

Chain of responsibility - Tic tac toe 5/7

after:

```
old
new
```

```
function checkRows() {
    for (i = 0; i < board.length; i++) {
        var same = true;
        for (j = 0; j < board[i].length; j++) {
            if (board[i][j] === 0 || board[i][j] !== board[i][0])
{
                same = false;
            }
        }
        if (same) {
            winningPlayer = turn.currentPlayerColor();
            // Alert winner
            endGame("Player " + winningPlayer + ", you win!");
        }
    }
    checkCols();};
```
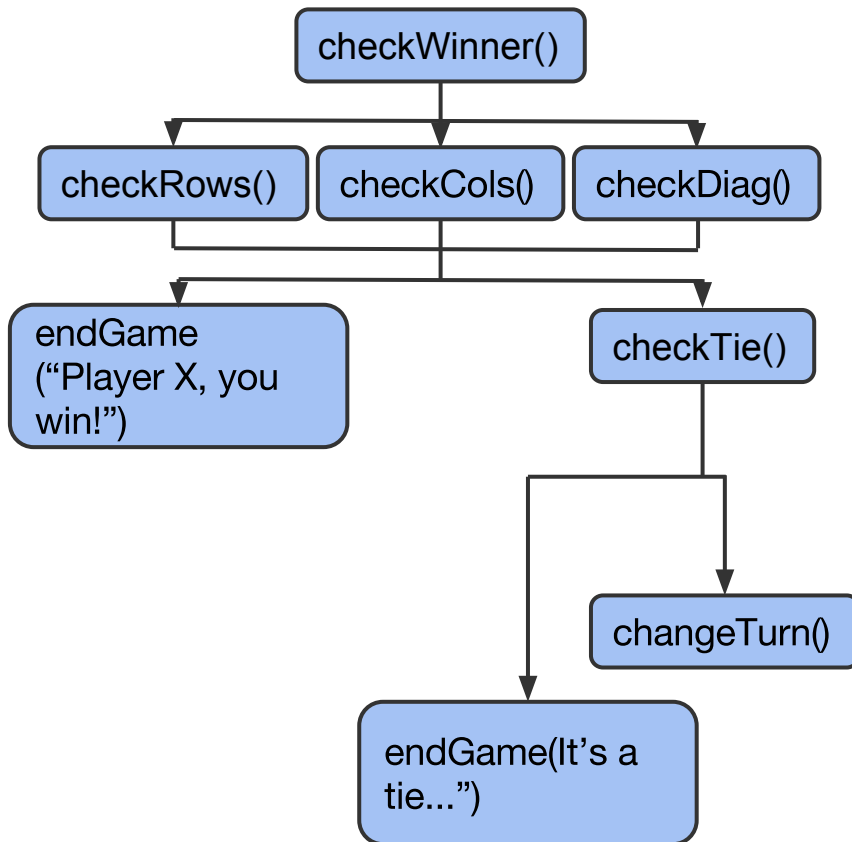

# Chain of responsibility - Tic tac toe 6/7

after:

```
function checkTie() {
    var flattenedBoard = Array.prototype.concat.apply([], board);
    for(i = 0; i < flattenedBoard.length; i++){
        if(flattenedBoard[i] === 0){
            console.log(i);
            turn.changeTurn();
            return;
        }
    }
    endGame("It's a tie...");
}
```

# Chain of responsibility - Tic tac toe 7/7

before:

after:

Observer

- Define a one-to-many dependency between objects

- When one object (Observable) changes its state, all dependent objects (Observers) are notified (usually with a message)

- Notified objects handle their own update

Observer - Participants

- **Subject / Observable**: maintains a list of observers, lets them subscribe/unsubscribe, and notifies them about changes

- **Observers**: has a function that can be invoked when notified
Pac Man

- retro game (classic pacman)

- 3 lives

- avoid getting eaten by ghosts

- can eat and "jail" the ghosts

  for a short time after eating

  "beans"

- eat all the blocks to a level

Observer – Pac Man 1/5

before:

```
function startLevel() {
    user.resetPosition();
    for (var i = 0; i < ghosts.length; i += 1) {
        ghosts[i].reset();
    }
    audio.play("start");
    timerStart = tick;
    setState(COUNTDOWN);
}
```

Observer – Pac Man 2/5

before:

```
function eatenPill() {
    audio.play("eatpill");
    timerStart = tick;
    eatenCount = 0;
    for (i = 0; i < ghosts.length; i += 1) {
        ghosts[i].makeEatable(ctx);
    }
};
```

Observer – Pac Man 3/5

after:

```
function startLevel() {
    user.resetPosition();
    notifyObservers("levelstarted");
    timerStart = tick;
    setState(COUNTDOWN);
}

[…]

function eatenPill() {
    timerStart = tick;
    eatenCount = 0;
    notifyObservers("pilleaten");
};
```

Observer – Pac Man 4/5

after:

```
//REFACTOR: adding observable functionalities
function subscribe(o) {
    observers.push(o);
};

function unsubscribe(o) {
    observers = observers.filter(
        function(item) {
            if (item !== o) { return item; } }
    ); };

function notifyObservers(message) {
    for (var i = observers.length - 1; i >= 0; i--) {
        observers[i].notify(message);
    }; };
```

Observer – Pac Man 5/5

after:

```
//REFACTOR: adding observer functionalities for Ghost
function notify(message) {
    switch(message) {
        case "levelstarted":
            reset();
            break;
        case "pilleaten":
            makeEatable();
            break;
        default:
            break;
    }
};
```

Projects

Spaceinvader: https://github.com/dwmkerr/spaceinvaders

Tic Tac Toe: https://github.com/negomi/tic-tac-toe

Pacman: https://github.com/daleharvey/pacman

Iterator

- access elements without knowing the underlying
  structure of the object

- effectively loop over a object collection

- object store as list, trees or more complex structures

- many language have build in iterator, but not
  JavaScript

- Iterator is the "secretary"

Iterator - Participants

Client: uses the iterator

Iterator: interface with methods like first(), next(), hasNext()

Items: individual objects

http://www.dofactory.com/images/diagrams/javascript/javascript-iterator.jpg
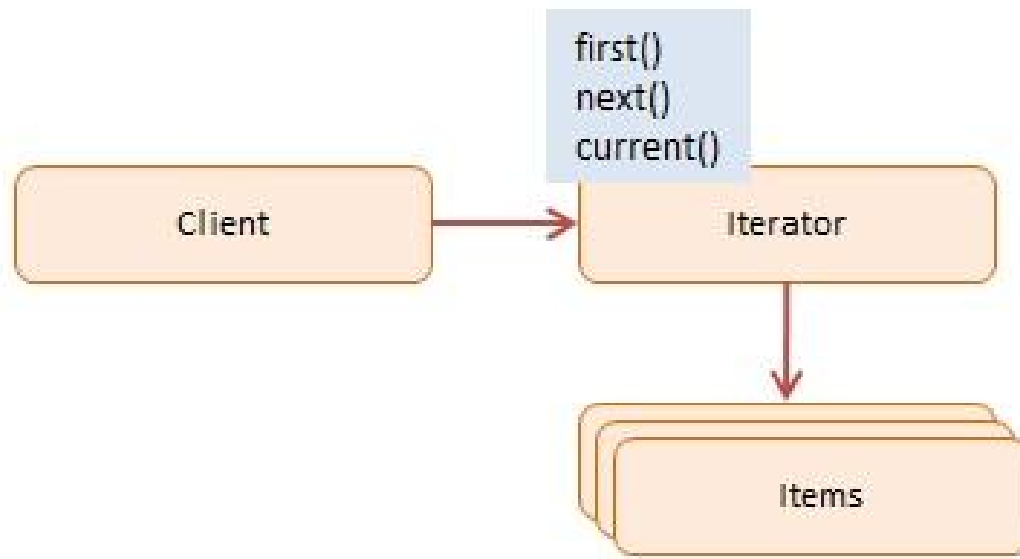

Strategie

- Interchangeable set of algorithms

- Swapped out at runtime

- Minimizing coupling

- Option to hide implementation

Strategie - Participants

Context: reference to the current Strategy, the option to

change it and to calculate the "cost" of each strategy

**Strategy**: implementation of different option for a task

Template method

- Outline of a series of steps for an algorithm

- Subclasses can redefine certain steps of an algorithm without changing the algorithms structure

- Offers extensibility to the client developer

Template method - Participants

AbstractClass: template method defining the primitive

steps for an algorithms

ConcreteClass: implements the primitive steps as defined

http://www.dofactory.com/images/diagrams/javascript/javascript-template-method.jpg
State

- A object can alter its behaviour when its internal state

  changes

- Object appears to have changed its class

- E.g. state machines

State - Participants

Context: maintains a reference to a object, defines its

current state, and allows it to change its state

State: state values are associated with the according

behaviour of the state

http://www.dofactory.com/images/diagrams/javascript-state.jpg
